Premium-trust compliance assessment

Gildenhall Freight | Vellumstone Laboratories binding-authority book

Prepared for Jarek Thackeray and Ruben Vanterpool • 24 August 2025

Purpose and control design

The proposed daily control uses a posted-position interpretation. It keeps the posted fiduciary liability visible, then adds a timing allowance only for a confirmed irrevocable carrier remittance while its liability release is not yet posted. The tested position is cleared trust balance minus posted liability plus that allowance. A genuine alert opens when the tested position is less than **-$25,000**; exactly -$25,000 is not an alert. A negative raw gap with supported next-business-day cure is labelled timing-only. An uncured timing case is escalated, and any residual beyond the allowance remains a genuine alert.

Why this avoids false alarms

The source history shows scheduled carrier debits posting before the corresponding liability release. A raw balance-minus-liability rule would therefore alarm routinely on remittance days. The allowance removes only that documented timing amount; it does not suppress a non-remittance deficiency or a residual deficit larger than the remittance.

Historical result	Value
Monitoring days	87
Genuine-alert days	2
Aggregate genuine shortfall	$100,000
Worst tested position	$-55,000 on 2025-06-10

The two validation episodes are the 10 June non-remittance deficiency and the 27 August residual shortfall on a remittance day. Ordinary confirmed remittance timing is not counted as genuine.

Scenario outlook through the examination date

Forecasts use the supplied weekday calendar from 1 September 2025 through 31 March 2026. Each intake pack contains two underlying risks; premium is converted before the cash and liability rollforward. The same $25,000 tested-position rule is applied in every case.

Case	Underlying units	Peak liability	Min tested	Alerts	First alert
Base plan	3,040	$1,746,240	$30,000	0	No alert
Accelerated intake	4,864	$2,096,416	$30,000	0	No alert
Stress / slower cure	6,688	$2,529,302	$-672,240	141	2025-09-16

Implementation recommendation

Implement the posted-position monitor immediately. It is transparent to the external partner, preserves evidence of bank-versus-ledger timing, and still caught both seeded genuine deficiencies in the short history. Petra Alcantara owns the daily review; Treasury Operations investigates bank posting and remittance support. Genuine alerts are sent to Jarek Thackeray and Ruben Vanterpool for same-day triage and examination reporting. Timing-only rows are documented and closed when the supplied cure evidence arrives.

Limitations and review point

The book is ramping quickly and the supplied history covers only four months, with no established seasonality. Missing settlement fields are left blank and excluded from calibration; forecasts are scenario illustrations, not certainty. Review the threshold weekly during the ramp and formally recalibrate at the 31 March 2026 examination milestone or sooner after a materially larger experience base.
