Stakeholder Review Notes

False alarms

A false alarm can create an avoidable reshoot and disrupt the following day. The team wants a visible distinction between a shoot-stopping decision and a watch-and-log outcome.

Late drift discovery

Sensor or camera drift may be gradual and easier to spot in like-for-like comparisons across cameras or depots. Evidence should be retained so a later review can trace the observation.

Usability

The instrument will be printed beside the DIT cart. Fields should be legible on paper and on a normal projector, with controlled statuses instead of free-form variations.

Approval ownership

Yolanda should record the technical observation and evidence reference. Beatriz should approve the production decision and any threshold before it is treated as policy.
