EXTERNAL CONTROL OFFICE

Frozen Emergency Access Control Snapshot

Wrenfield Health Network / Marchbank Holdings enterprise context

FROZEN EVIDENCE POSITION	As of 2025-06-30 | External control-office snapshot

Scope of this snapshot

This frozen extract records the control vocabulary and evidence position used for enterprise emergency or break-glass access to patient and clinical records. It is a temporal record as at the stated date, not a reconstruction of all historical activity.

Control vocabulary

Control	Frozen control statement
EAC-01	Emergency access is limited to an immediate patient-safety or continuity-of-care risk where ordinary authorization is unavailable or delay through it would create harmful delay.
EAC-02	The event record must contain the actor, event time, affected patient/record or entity reference, reason for access, and outcome or review reference sufficient to assess the event.
EAC-03	Emergency-access activity is subject to retrospective review; review is an accountability control and is not original authorization.
DAT-02	Audit and justification records use the minimum necessary patient identifier and related detail for the purpose of understanding and assessing the event.
AUD-04	Audit records use a canonical entity-code concept and preserve event integrity; malformed or unresolved codes are evidence limitations, not grounds for silent inference.

Observed log excerpt

Selected rows retained in the frozen material. References are non-identifying system references.

Row	Event ref	Actor ref	Event time (UTC)	Record ref	Recorded label	Entity code	Review ref
3412	EV-22016	BRK-701	2025-06-28 02:14:08	REC-8J4Q	break-glass	WHN-ED-04	RR-861
3413	EV-22016	BRK-701	2025-06-28 02:14:08	REC-8J4Q	break-glass	WHN-ED-04	RR-861
3471	EV-22019	CLN-164	2025-06-28 06:43:11	REC-2Y7M	Urgent	MBH-CV-??	RR-865
3518	EV-22022	IMR-052	2025-06-28 11:05:42	REC-0K1T	Emergency	WNH_ER4	RR-869
3530	EV-22023	BRK-702	2025-06-28 13:35:09	REC-4P6D	Break Glass		RR-873
3557	EV-22027	SUP-018	2025-06-28 16:51:26	REC-7C3L	urgent	MBH-W-1?7	RR-876

Observed evidence and its limits

The frozen material contains duplicate log representation of the same underlying access event: the matched rows share the event reference, actor, event time, record reference, label, entity code, and review reference. It also contains entity-code values that are malformed or cannot be resolved to the canonical entity-code concept. Emergency-related labels are inconsistent across the records, including emergency, urgent, and break-glass variants.

These observations support that the records and stated data-quality defects exist. They do not establish that every emergency-related label denotes a justified emergency or that every such event was properly authorized. A recorded event is distinct from proof that the emergency criterion or authorization requirement was satisfied. An absent, malformed, or unresolved entity code does not establish that access was unauthorized or that no emergency existed.

Historical labels remain evidence of what was recorded; they are not automatically conforming target-state labels. The snapshot does not establish universal compliance, universal non-compliance, or a conclusion beyond the observed material.

Justification and minimum-necessary detail

A complete justification can require a patient identity or record reference where that identity is central to understanding the emergency. DAT-02 limits the record to the minimum identifier and related context necessary to understand and assess the event. This snapshot does not support either an absolute rule to omit all identifiers or an unrestricted clinical narrative.

Transition and review boundary

A legacy logging and label arrangement remains during migration to one enterprise standard. The target state uses controlled emergency-access language, canonical entity-code treatment, the EAC-02 event-context fields, and retrospective review. Historical artifacts do not automatically demonstrate target-state conformity, and this snapshot does not prescribe an implementation sequence.

The recorded review window is 48 hours. The material does not include a complete historical-log reconstruction or patient-by-patient validation; conclusions must remain bounded to the frozen evidence position as of 2025-06-30.

Claim-status register

Supported by the snapshot	Not established by the snapshot
Named controls and their stated meanings; duplicate representation, malformed or unresolved codes, inconsistent emergency-related labels; event context, minimum-necessary identifiers, and retrospective review.	That every emergency, urgent, or break-glass record was a genuine emergency, authorized, or compliant; that a code defect proves unauthorized access or no emergency; that review cures an unjustified original access.
Historical labels evidence what was recorded; the legacy arrangement remains during transition.	That minimization permits removal of essential event context; that completeness permits unrestricted patient detail; or that the target state already applies uniformly to legacy records.
