Tidewater Works Inspection Training Instructor Guide

Purpose and Use

Use this guide to deliver the inspection-training session and to document an auditable competency decision. Keep fixed competency wording unchanged. Enter trainee, assessor, and review information only in the designated fields of the competency matrix.

Inspection Training Overview

The session follows a repeatable sequence: prepare the inspection area, observe the demonstration, capture objective evidence, compare evidence with the criteria, and record a result for each competency.

Before the Demonstration

Confirm the equipment identity and inspection materials. Explain that evidence must be specific enough for another reviewer to understand what was observed. Review the four result statuses before work begins.

During the Demonstration

Observe without coaching the demonstrated step unless an immediate safety concern requires intervention. Capture the condition, location, and supporting evidence. Use the same competency order in the matrix as in this guide.

During delivery, the instructor keeps the observation record factual and concise. The assessor may pause the activity for a safety control, then resumes the same evidence sequence.

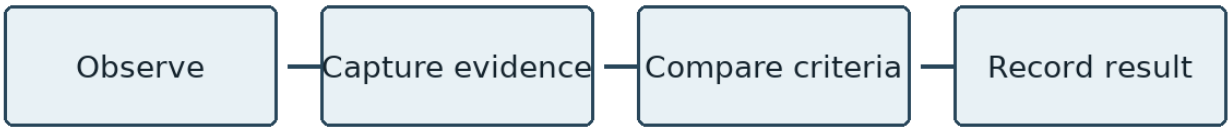

Figure 1: Inspection evidence flow

Evidence is useful when it is observable, tied to the inspection focus, and recorded at the time of the demonstration. Avoid inferring competence from a general impression.

After the demonstration, review each row in order. A result describes the observed performance at the time of assessment; it does not replace the evidence note or the follow-up record.

Evidence and Competency Review

Recording an Assessment

Enter the trainee name, assessor name, and assessment date before recording results. Select one of the matrix statuses: Not started, In progress, Competent, or Needs retraining. Leave a result blank until the related evidence has been reviewed.

During review, the assessor enters reviewer initials and review date. The assessor also assigns the follow-up owner and due date when a row is not Competent. The completion rate, outstanding competencies, and overall readiness fields are calculated by the workbook and must not be typed.

Figure 2: Competency decision path

Use the same status vocabulary in any spoken debrief and in the matrix. If evidence is incomplete, keep the result at Not started or In progress until the assessor can support a decision.

Escalation and Follow-up

When a defect or performance gap requires action, record the condition and assign the follow-up owner during review. Set a due date that can be audited. Items marked Needs retraining remain outstanding until a later assessment records Competent.

Competency Matrix

Competency ID	Inspection focus	Evidence expected	Result	Reviewer initials	Review date	Follow-up owner	Follow-up due
IT-01	Verify equipment identity and service record	Matches work order; label is legible and current					
IT-02	Check housing, seams, and fasteners	No cracks, loose stitching, or missing hardware					
IT-03	Inspect straps, webbing, and adjustment points	Webbing is intact; adjustments move and lock					
IT-04	Examine connectors, hooks, and latches	Connectors close fully and show no deformation					
IT-05	Assess protective surfaces and coatings	Surface is clean, continuous, and free of contamination					
IT-06	Confirm markings, warnings, and traceability	Required markings are present and traceable					
IT-07	Perform functional movement check	Moving parts operate through the specified range					
IT-08	Identify defects requiring quarantine	Defects are described and item is isolated when needed					
IT-09	Record inspection evidence clearly	Notes identify condition, location, and supporting evidence					
IT-10	Communicate disposition and escalation	Disposition is stated and escalation path is followed					

Entry cells are shaded for assessor use; fixed competency text is retained for audit. The workbook mirrors this table cell for cell.

Competency ID	Inspection focus	Evidence expected	Result	Reviewer initials	Review date	Follow-up owner	Follow-up due
IT-01	Verify equipment identity and service label	Matches work order; label is legible and current					
IT-02	Check housing, seams, and fasteners	No cracks, loose stitching, or missing hardware					
IT-03	Inspect straps, webbing, and adjusters	Webbing is intact; adjustments move and lock					
IT-04	Examine connectors, hooks, and latches	Connectors close fully and show no deformation					
IT-05	Assess protective surfaces and coatings	Surface is clean, continuous, and free of contamination					
IT-06	Confirm markings, warnings, and traceability	Required markings are present and traceable					
IT-07	Perform functional movement check	Moving parts operate through the specified range					
IT-08	Identify defects requiring quarantine	Defects are described and item is isolated when needed					
IT-09	Record inspection evidence clearly	Notes identify condition, location, and supporting evidence					
IT-10	Communicate disposition and escalation	Disposition is stated and escalation path is followed
