Equipment Incident Paper Edit

North Bay | regulator-facing review cut | prepared by Ragnhild Fairbairn for Mahdi Kirchner and Thursday's oversight review

Recommendation

Recommend Option A: the chronological, corroborated cut of 5 distinct source clips (00:00:34:10 at 25 fps) from 3 delivery containers. It retains GN-EI-017 only because its guard-side angle records the indicator-state cue that the primary overhead view does not show. The recommendation is an editorial choice; the chronology, source ranges, captions, camera descriptions, and witness references are recorded evidence.

Option A is the more practical review cut because it covers the approach, shutdown, and first immediate consequence without padding the sequence with later stillness or an angle that supplies no additional evidence. Its estimated finishing effort is $1,917.55; it remains below one minute and does not use media-package count as a clip or cost proxy.

Option	Selected coverage	Runtime	Evidence and disclosure treatment	Finishing estimate	Recommendation
A - chronological corroborated cut	GN-EI-014, GN-EI-015, GN-EI-016, GN-EI-017, GN-EI-018	**00:00:34:10**	Retains GN-EI-017 as a same-moment corroborating angle for the indicator change. Discloses omitted repeats and out-of-scope clips in Evidence Notes.	**$1,917.55**	**Approve for conform**
B - minimum phase-complete cut	GN-EI-014, GN-EI-015, GN-EI-016, GN-EI-018	**00:00:27:17**	Omits GN-EI-017; remains phase-complete but removes the visible indicator-state corroboration. It still requires disclosure of that reviewed angle.	**$1,534.04**	Credible lower-effort alternative

Recorded facts versus editorial choices: event timestamps establish order; source timecodes locate the selected ranges. Direct cuts, the decision to retain the indicator view, and the decision to omit repeated or irrelevant coverage are editorial treatments made under the disclosure policy.

Paper Edit

Selected count: 5 distinct Clip IDs. Source timecode convention: HH:MM:SS:FF at 25 fps. Transition rule: every join is a direct hard cut of 0 frames; no dissolve, retime, title card, or added material. The E03 angle change is labeled as the same shutdown moment, not an additional event.

Event order	Clip ID	Media pack (container)	Source camera / angle	Event time UTC	Source in	Source out	Duration	Transition after range	Source-supported caption
1 Precursor / approach	**GN-EI-014**	MP-NB-07	Cam 2 - corridor wide	2026-08-11 09:14:02.000	01:00:10:00	01:00:17:12	00:00:07:12	Hard cut to next recorded event; 0 frames.	Operator approaches the north-bay control station.
2 Precursor / approach	**GN-EI-015**	MP-NB-07	Cam 4 - panel close	2026-08-11 09:14:08.000	00:43:22:05	00:43:27:15	00:00:05:10	Hard cut to next recorded event; 0 frames.	Hand reaches the emergency-stop guard at the north-bay panel.
3 Critical shutdown	**GN-EI-016**	MP-NB-11	Cam 1 - overhead bay	2026-08-11 09:14:15.120	00:05:50:10	00:05:58:05	00:00:07:20	Hard cut to corroborating same-moment angle; 0 frames.	Emergency-stop actuator is depressed; conveyor movement ceases.
3 (same moment) Critical shutdown	**GN-EI-017**	MP-NB-11	Cam 3 - guard-side medium	2026-08-11 09:14:15.360	00:12:32:00	00:12:38:18	00:00:06:18	Hard cut to next recorded event; 0 frames.	Guard-side view records the stop indicator changing from green to amber.
4 Immediate aftermath	**GN-EI-018**	MP-NB-16	Cam 5 - exit lane wide	2026-08-11 09:14:19.100	00:21:03:12	00:21:10:12	00:00:07:00	End of cut; no added card.	Personnel step back from the north bay after conveyor movement ceases.

Running time: 00:00:34:10 (860 frames) = 00:00:07:12 + 00:00:05:10 + 00:00:07:20 + 00:00:06:18 + 00:00:07:00. Direct cuts have zero added duration; no title-card duration is included.

The selected clips come from three media packs, but the count, runtime, coverage, and finishing estimate use the five distinct Clip IDs. A media pack is shown only as a delivery-container trace.

Evidence Notes

Recorded evidence: the index event timestamps place the approach, guarded-control reach, shutdown, and step-back in that order. GN-EI-016 records actuator depression and cessation of conveyor movement. GN-EI-017 is retained as a second view of the same E03 shutdown moment because its indexed caption records the green-to-amber indicator change; it is not treated as a fifth incident event. The captions in the Paper Edit are reproduced from the index.

Editorial treatment: Option A chooses the shortest chronological set that preserves those material phases and the distinct indicator-state corroboration. Hard cuts are an editorial device only; they do not imply that the source ranges are continuous takes or change their recorded order.

Disclosure of reviewed omissions

Reviewed item	Source camera / angle	Classification	Disclosure reason
GN-EI-019	Cam 2 - corridor wide	In scope - repeated	In-scope repeated later hold. It repeats the stopped-and-clear condition after GN-EI-018 and adds no new material change; omitted to avoid padding.
GN-EI-020	Cam 6 - loading dock	Out of scope	Out of scope. Loading-dock activity is a different location and is not part of the North Bay incident-review scope.
GN-EI-021	Cam 7 - ceiling overview	In scope - repeated	In-scope repeated E03 angle. It records the same emergency-stop interval and adds no panel or indicator detail beyond GN-EI-016 and GN-EI-017.
GN-EI-022	Cam 8 - south aisle	Out of scope	Out of scope. South-aisle activity occurs after the review window and is not incident footage for this cut.

Phase-level coverage summary

Coverage uses distinct selected Clip IDs and distinct witness-reference codes in each phase. The post-incident-context row has no selected clips; the explicit convention is N/A, not zero or a finite rate, because the denominator is zero.

Phase	Distinct selected clips	Distinct supporting witness refs	Calculation	Coverage result
Precursor / approach	2	W-02, W-04	2 refs / 2 clips	**1.00 refs/clip**
Critical shutdown	2	W-01, W-03, W-05	3 refs / 2 clips	**1.50 refs/clip**
Immediate aftermath	1	W-04, W-05	2 refs / 1 clips	**2.00 refs/clip**
Post-incident context	0	None from selected clips	0 refs / 0 clips	**N/A**

Finishing-Cost Comparison

All rates are normalized to currency precision before multiplication. The source rate with an extended decimal representation is treated as $173.46 USD per distinct selected source clip. Every option quantity below is a distinct Clip ID count, not a media-package count.

Finishing action	Rate and unit	Option A qty	Option A estimate	Option B qty	Option B estimate
Conform and source relink	$173.46 USD / distinct selected source clip	5 clips	$173.46 x 5 = $867.30	4 clips	$173.46 x 4 = $693.84
Caption placement and review	$88.75 USD / distinct selected source clip	5 clips	$88.75 x 5 = $443.75	4 clips	$88.75 x 4 = $355.00
QC review pass	$121.30 USD / distinct selected source clip	5 clips	$121.30 x 5 = $606.50	4 clips	$121.30 x 4 = $485.20
Total finishing estimate	Sum of action estimates	**5 clips**	**$1,917.55**	**4 clips**	**$1,534.04**

Finishing Plan

These actions are tied to Option A only. Dependencies preserve source chronology and keep counsel's approval path visible before Thursday.

Action	Concrete output	Owner	Timing / dependency
Evidence lock	Verify Option A Clip IDs, source in/out ranges, and witness-reference links against the index.	Simone Magnusson	Before Ragnhild begins conform; complete on approval day.
Conform	Conform the five Option A ranges in Paper Edit order with the stated zero-frame hard cuts and no retime.	Ragnhild Fairbairn	Immediately after evidence lock; before caption placement.
Caption	Apply the five source-supported captions exactly as listed; confirm source wording before export.	Ragnhild Fairbairn	After conform and before QC; complete before legal review.
Quality control	Check playback, source timecodes, duration sum, event order, caption text, and disclosed omissions against this paper edit.	Ainsley Bonneau	After caption pass; provide a signed QC note before legal review.
Legal review	Review the cut, disclosures, and cost basis for counsel approval of the oversight-review version.	Mahdi Kirchner	After QC sign-off and before Thursday oversight review.
Secure review export	Create the approved review export only after Mahdi's approval; retain the paper-edit identifiers in the delivery record.	Lorcan Underwood	Following legal approval; deliver before Thursday review distribution.

Method Note

Source and chronology: read Clip ID, media-pack, camera/angle, source in/out, event time, phase, review scope, caption wording, witness refs, and rate-card fields from the index; read chronology and disclosure policy from the dossier. Sort selected In scope clips by the authoritative Event time UTC field. Do not use Legacy seq helper. E03 has two selected views, so the second is marked the same moment rather than counted as an additional event.

Timecode and duration: preserve supplied HH:MM:SS:FF at 25 fps. For each row, duration frames = source out frames minus source in frames. Sum the five durations; hard cuts and no title card add 0 frames. Event timestamps are source timing fields, not converted presentation timecodes.

Disclosure and captions: retain a repeated angle only when its indexed note and caption supply a distinct cue; disclose reviewed In scope - repeated and Out of scope records by Clip ID, angle, and reason. Captions are copied from the index; no cause, intent, identity, or technical conclusion is added.

Coverage: for every index phase, numerator = distinct witness-reference codes on selected clips in that phase; denominator = distinct selected Clip IDs in that phase. Display refs/clip. Where denominator = 0, report N/A consistently because no valid rate can be computed.

Costs: normalize each source rate to nearest USD cent before multiplication. For every action, quantity = the option's distinct selected Clip IDs under the supplied USD-per-clip basis; round each action estimate to cents and sum them. Media-pack values trace containers only. Option B is independently recalculated after removing the same-moment indicator-angle clip.
